

NOTE TAKING APP

Bugs and their solutions

- There is no “GET” method in the line `@app.route('/', methods = [“POST”])`, there should be get method because whenever we open web application, initial request is “GET”.
- In home.html page in form it should have method = “post” because the details entered by user must be confidential.
- If we use method as “post” in html page then in app.py page we have to mention `request.form.get()` instead of `request.args.get()`
